Integrating layout planning and simulation for logistic nodes

When a new logistic node (e.g., a terminal) is planned or needs to be optimized, layout planning and simulation analysis are typically two separate tasks. While layout planning is an intuitive and visual but static approach, simulation is dynamic but more complex. Integrating both approaches would be highly beneficial. The idea of the integrated tool is to create a static layout on a touch-screen planning table. Main challenges for a successful integration are the logistic processes and strategies on the terminal. Both are not included in the layout planning but are essential for a valid and realistic simulation model. Therefore, relevant process and strategy variations as well as typical research questions are defined. The integrated approach is an innovative solution to optimize existing terminals, as well as those being planned.

In order to realize the integration of layout planning and simulation, two existing software tools are chosen. Thereby, the planning software visTABLE® by plavis and our simulation software Enterprise Dynamics® represent the respective software. The integration can reduce the required time to plan a logistic node significantly as simulation models have to be modeled otherwise by experts in extensive work based on the designed layout. Further project partners are the Fraunhofer CML, the Institute for Maritime Logistics (IML) and the Study Association for Combined Transport e.V. (SGKV).

Therefore, this innovation directly supports an efficient and rapid planning phase of logistic nodes to provision an extension of transport infrastructure suitable to the market needs. The integration of layout planning and simulation studies is - in a first step - developed for inland waterway container terminals and terminals for intermodal transport.

The goal of the research project ISI-Plan is the creation of a functional prototype consisting of the innovative integration of the planning table and the logistical process simulation. Therefore, that prototype will support the rapid and efficient planning and development of logistics hubs.

This innovative software tool directly supports efficient and fast planning of logistic nodes, which are necessary for a demand-oriented expansion of the transport infrastructure. In Germany alone, there are more than 500 logistic nodes that can benefit directly from the integrated planning and simulation tool. This work was funded by the German Federal Ministry of Education and Research (BMBF) as part of the research project "ISI-Plan - Integration von ereignis-diskreter Logistiksimulation und Layoutplanung für logistische Knoten."

Simulating in a digital world

Business processes are inextricably digitalized. That is exactly where INCONTROL Simulation Software positions its Enterprise Resource Simulation Platform® (ERSP). ERSP enables organizations to innovate and improve their business processes.

The platform is not only used in the design and analysis phase but also on a daily basis to support planning and decision-making processes.

INCONTROL Simulation Software is integrated in curricula at Universities, Applied Sciences and R&D Institutes. Together with these partners we have implemented solutions in the Process Industry, Transportation, Logistics, Crowd Management and Public Safety.

Interested? We want to share our vision, technology insights and business cases on how simulation can improve your performance.
